

Patient Name: Rajesh Kumar

Age: 45 years

Address: 123, Green Park, New Delhi, India

Hospital Name: Apollo Hospital, New Delhi

Rajesh Kumar, a 45-year-old resident of Green Park, New Delhi, was admitted to Apollo Hospital on February 25, 2025, with complaints of persistent chest pain and shortness of breath. Upon initial examination, doctors conducted an ECG and blood tests, which indicated signs of coronary artery disease. Further investigations, including an angiography, revealed a 70% blockage in one of the main coronary arteries. The patient was advised to undergo an angioplasty procedure to restore normal blood flow. His medical history indicates that he has been a smoker for over 20 years and has a family history of heart disease.

During his stay at Apollo Hospital, he was placed under constant monitoring, and his vitals were regularly checked. A team of cardiologists prescribed medications, including blood thinners and cholesterol-lowering drugs, to manage his condition. Post-procedure, Rajesh Kumar was advised to adopt a heart-healthy diet, engage in regular physical activity, and quit smoking. He was also scheduled for a follow-up appointment in two weeks to assess his recovery progress. The doctors emphasized the importance of lifestyle modifications to prevent further complications.

Currently, Rajesh is in stable condition and has shown significant improvement in his health. He has been discharged with a detailed medical report and prescriptions for continued medication. His family has been counseled on necessary precautions and emergency measures in case of any further health concerns.
